

We use **Scandinavian wood** for production, which makes it resistant to various weather conditions. We **dry** and coat our wood with **impregnation**. However, when exposed to sun, rain or snow, it requires re-impregnation **once every six months**. Also to maintain **the guarantee**.

## *How to take care of our products?*

### IMPREGNATE

**The guarantee** only applies when **water-based impregnates** are used. The use of solvent-based ones voids the guarantee. We are not in a position to guarantee the durability of such an impregnate on native wood.

## IMPREGNATION METHOD

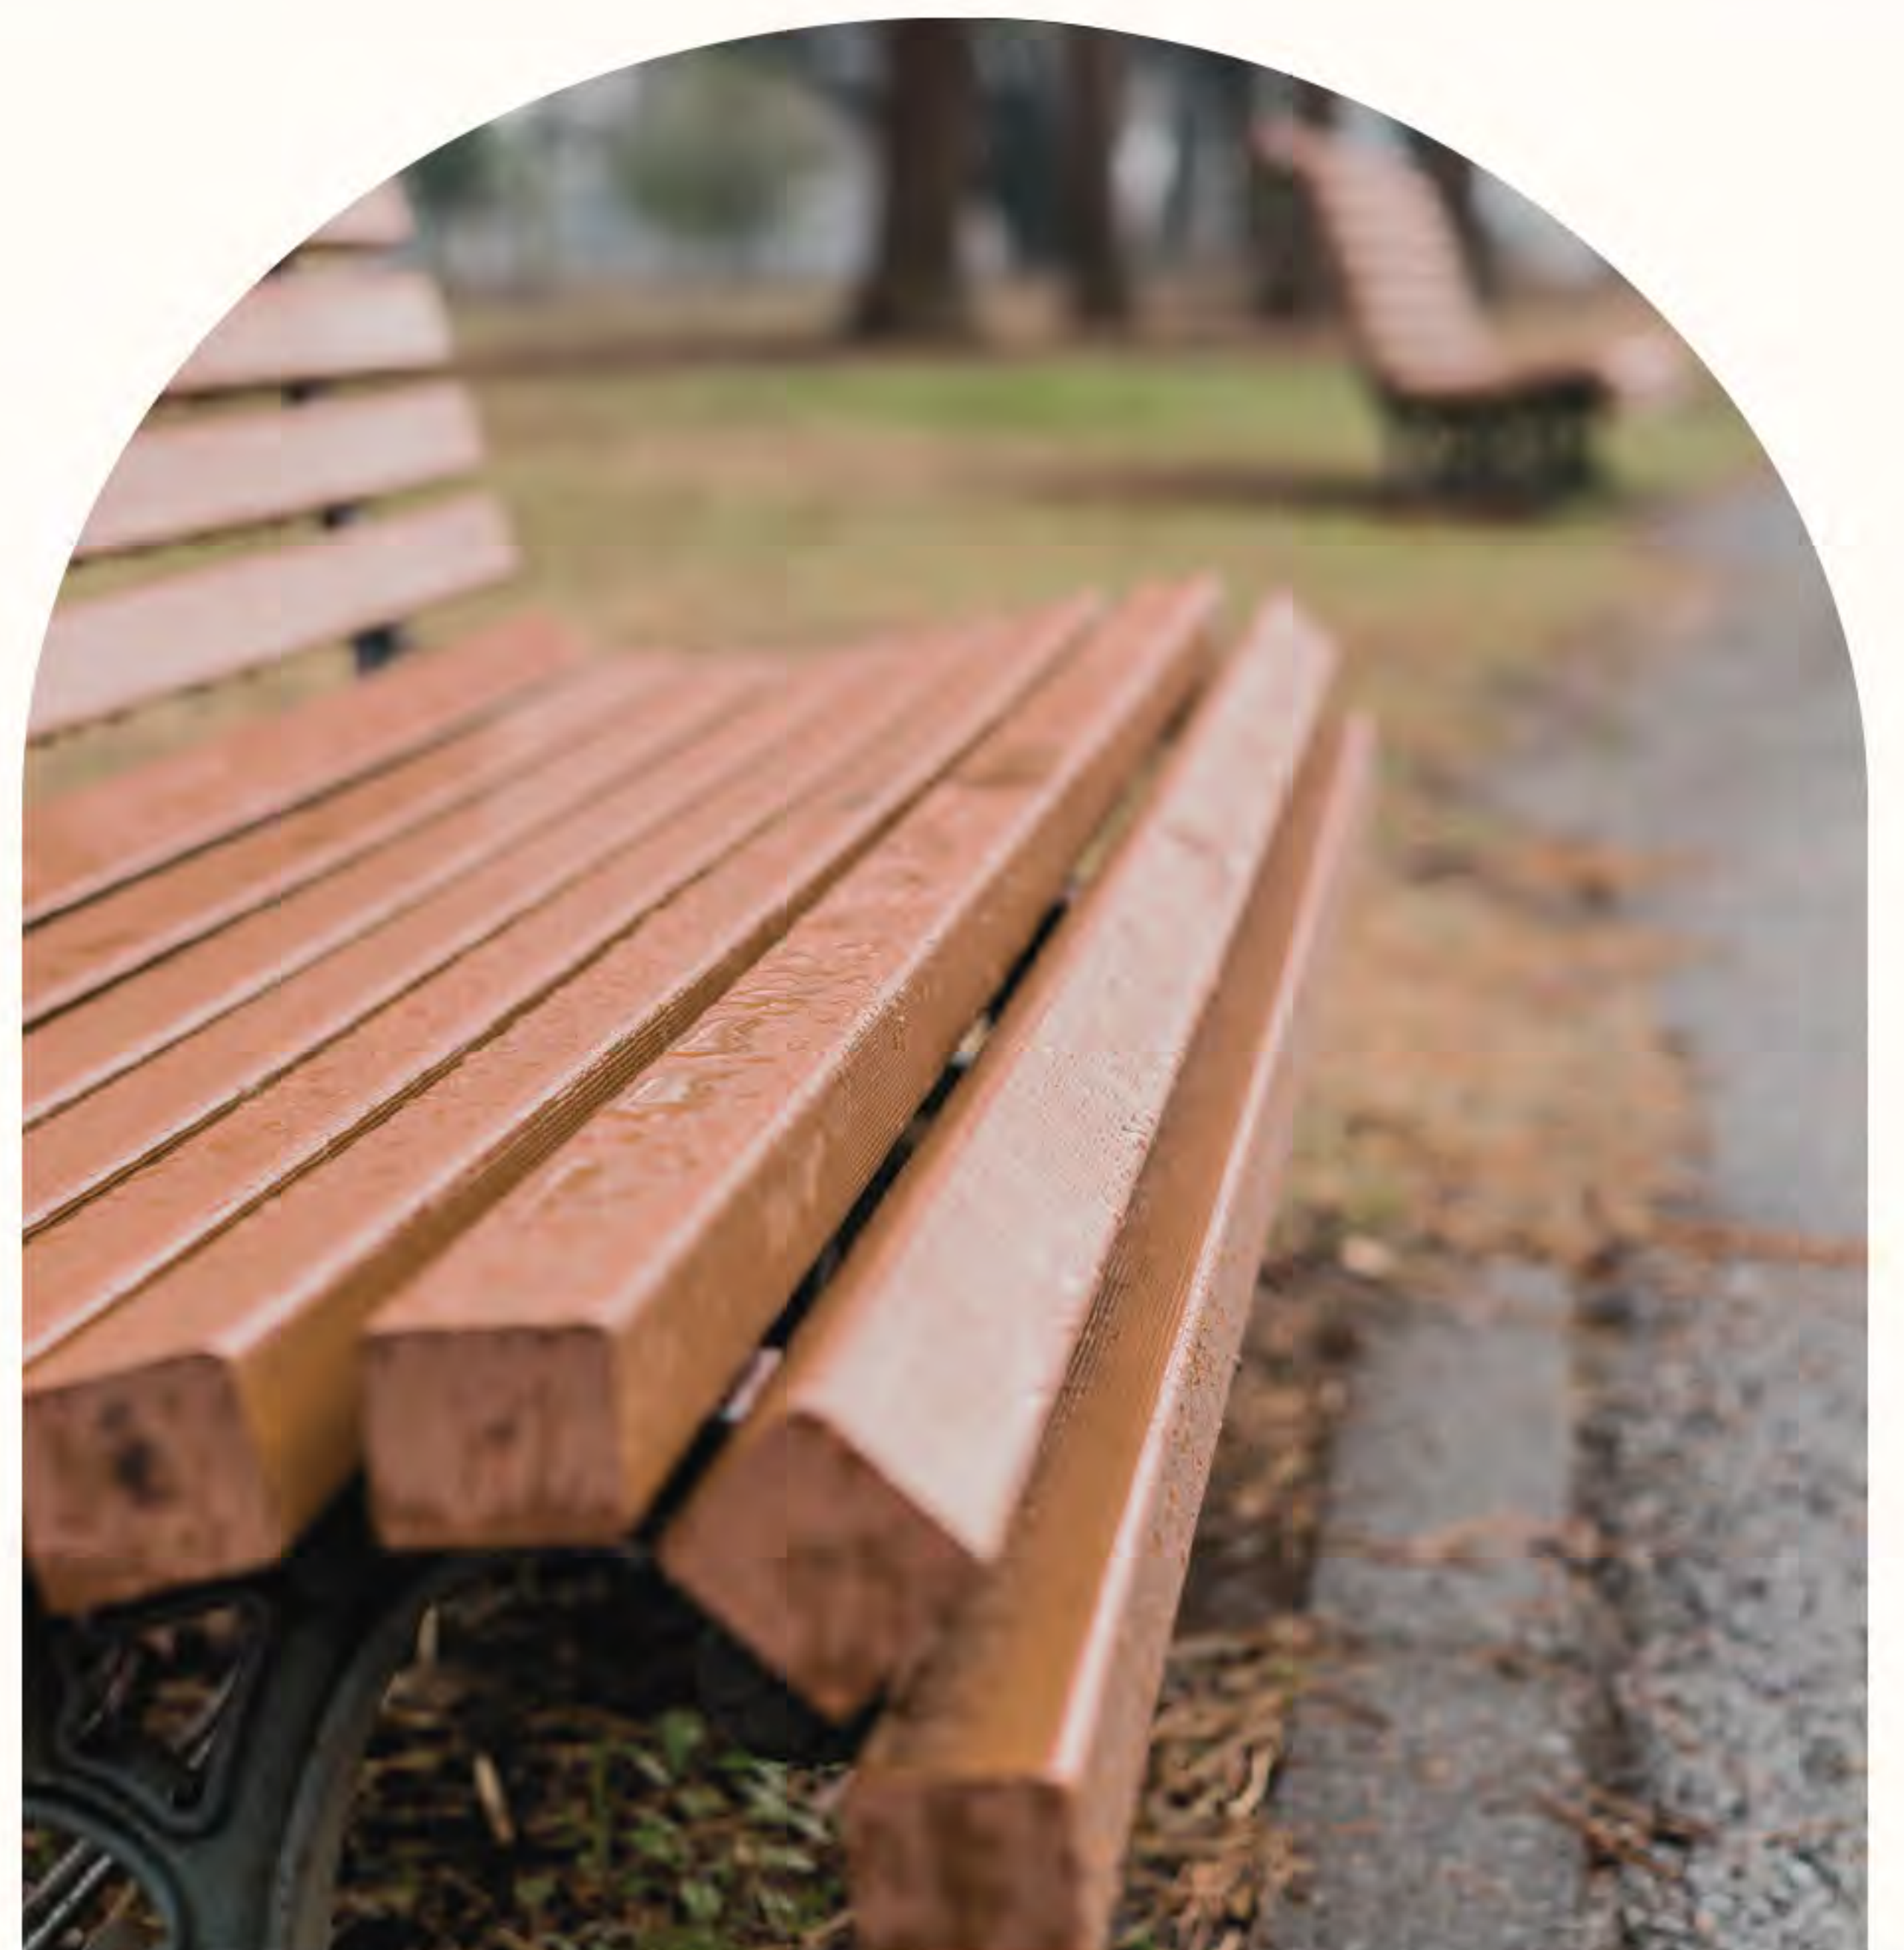

Before impregnating, the boards **must be prepared by sanding them** with sandpaper no coarser than grain size 220. After thorough dust removal and sanding, the impregnating agent can be applied (**2 coats**). The application method is always indicated on the manufacturer's packaging

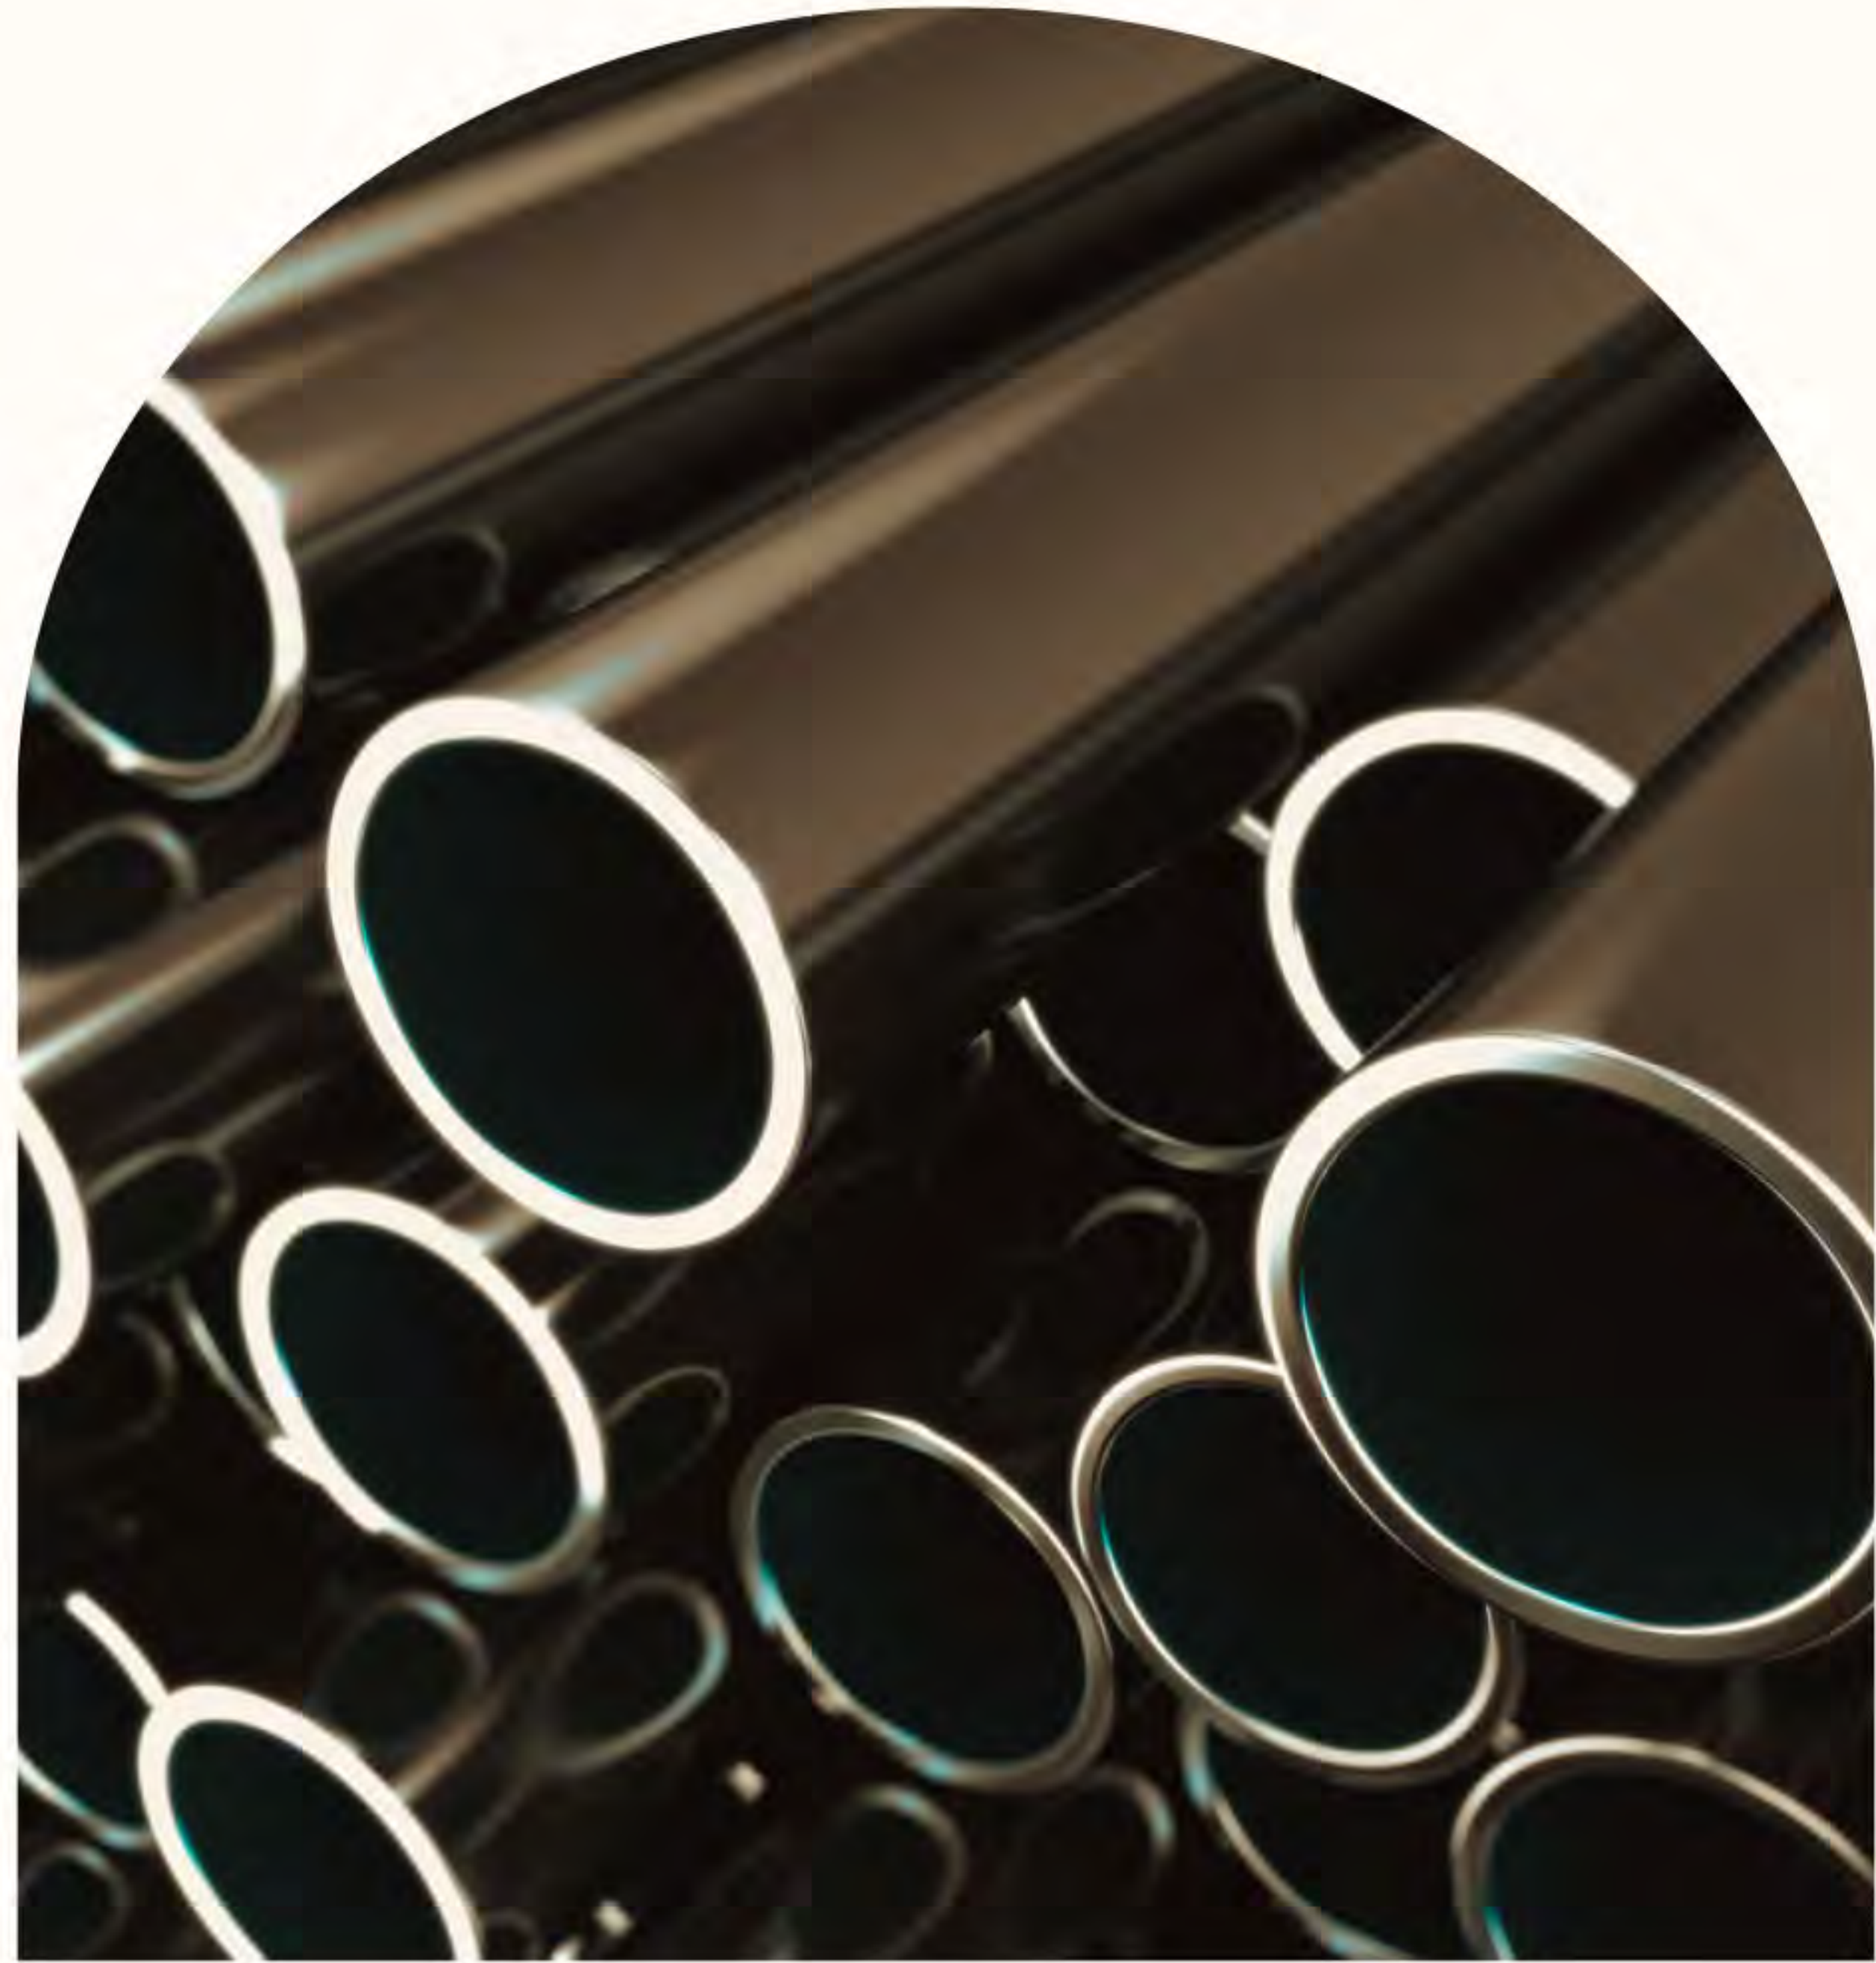

# *How to take care of our products?*

## WHAT ABOUT THE RAIN?

To prolong the life of our benches, we recommend that excessive accumulation of rain and snow is prevented.

## METAL COMPONENTS

In the case of metal components, little prevention is required, but a few points must be borne in mind. **Plastic caps**, the protection for metal ends, must **always be in place**. If they fall off or are damaged, they **must be replaced immediately**.

# *How to take care of our products?*

The bench **should not** be installed in **puddles** or in areas of **excessive standing water**. The mounting substrate should be **dry and suitably hardened**. The benches have fixing holes, when installing, remember to put washers (rubber and metal) on so as not to damage the footing components.
